

Scooby's Kitchen — Platform Feature Guide

Sep 27, 2026 · @lokesh

Overview

Scooby's Kitchen is a pet-care platform that combines a fresh dog-food shop, a veterinary consultation network and an AI assistant, delivered as one website and one native mobile app on a shared backend.

Who uses it

Role	What they do
Pet parent (customer)	Shops recipes, manages pet profiles, books vet consultations, finds nearby clinics, chats with the AI assistant, tracks orders
Veterinarian	Manages a booking queue, sets weekly availability, joins video consultations, writes medical notes
Administrator	Manages products, stock, orders, doctors, coupons, support tickets and which features are switched on

Surfaces

Surface	Built with	Notes
Website	React + Vite	Customer, doctor and admin areas in one app
Mobile app	React Native / Expo (Android and iOS)	Customer app plus a separate doctor tab set; one design language across both operating systems
Backend API	FastAPI, PostgreSQL, Redis	Single source of truth for both surfaces
Supporting services	Chatbot, pet-vision, ML inference, MCP tool server	Run as separate services next to the API

Brand: canine-tested, small-batch "kitchen journal" look, set in Outfit, Quicksand and Courier Prime, with ochre and sage accents on a warm cream background.

Customer features

A pet parent can sign up, build a pet profile, shop, pay, track delivery, get vet and AI help, and raise support tickets, on both website and app.

Sign-in and accounts

- Passwordless sign-in by emailed magic link or one-time code, plus Google sign-in.
- Phone verification through Firebase OTP; an unverified phone is prompted before checkout.
- Session refresh runs silently; logging out revokes the refresh token.
- Profile lets the user edit details and upload an avatar.

Home

The home screen opens with a rotating banner, a recipe search bar, and a "Scooby Care & Services" block: Scan & Diagnose, Shop Recipes, Vet Consults, My Orders and Know Your Pet. Signature recipes, a Meal Planner card and doctor reviews follow. Cards are driven by feature flags, so a switched-off service can show "Coming soon" instead of disappearing.

Shop and cart

- Recipe catalog with categories, product galleries, stock badges, favourites and verified reviews (only buyers can review; eligibility is checked per product).
- Live stock: the cart re-syncs live stock, so an item that sold out is flagged before payment.
- Coupons: percentage or flat discounts with an optional cap, minimum order value, validity window and usage limit; the discount previews live at checkout and invalid codes return a specific message.

Checkout and payment

1. The user confirms a delivery address. A draggable map pin, pincode lookup and GPS "locate me" fill the fields.
2. The order is created and a Razorpay payment session opens.
3. The payment signature is verified server-side; a Razorpay webhook is the backstop if the app closes mid-payment.
4. The order moves to Confirmed and the cart clears.

Orders and tracking

Orders progress through Pending, Confirmed, Processing, Packed, Shipped, In transit, Out for delivery and Delivered. Returned, Delivery failed and Cancelled are also handled. Each order has a tracking view and a cancel action.

Pets (Know Your Pet)

Pet profiles hold name, species, breed, gender, date of birth, weight and a photo. Each pet keeps a health-record history, and records can be linked to the consultation they came from.

Meal Planner

A short diet quiz, usable at any time, asks for the dog's name, sex and neutered status, breed and weight, and activity level. It ends in a personalised recipe recommendation in about 90 seconds.

AI assistant

A chat assistant answers nutrition and product questions and can act for the user: search products, check stock, look up orders and tracking, list pets and consultations, find open slots, and book or cancel a consultation or order. Actions use single-use tokens and idempotency keys, so a repeated request cannot double-book.

Scan & Diagnose

The user photographs a pet. A separate vision service classifies species and breed and returns a tailored nutrition blueprint.

Support and notifications

- Support tickets with a threaded conversation, unread counts and status changes by admins.
- In-app notification feed with unread badge and mark-all-read, real-time over WebSocket, plus mobile push notifications.

Vet consultations and Vets Near Me

The Specialist Directory has two views behind a toggle: Browse Our Vets for booking a registered doctor, and Vets Near Me for finding real clinics by location. Both live under the Consult tab.

Browse Our Vets and booking

The directory lists verified doctors with specialisation, qualification, experience, clinic city and fee. It can be searched by name and filtered by city and specialisation. "View Bio & Shifts" opens a side drawer with the doctor's profile and weekly schedule.

1. Choose a doctor, then a pet, a date and an open time slot. Slots already in the past are hidden for today.
2. The app creates a payment intent for the consultation fee and opens Razorpay.
3. After payment, the booking is created and confirmed in one step.
4. At the scheduled time both sides join a Jitsi video room. Joins and leaves are audited.
5. The doctor writes notes into the pet's health record. A consultation that is left open closes automatically 15 minutes after its scheduled end, with an auto-generated note if none was written.
6. The pet parent can rate the doctor afterwards.

If a chosen doctor has no suitable slot, the app can suggest alternative doctors in the same city or specialisation (a feature flag).

Vets Near Me

Shows registered vets and real-world clinics from Google Places together, sorted by distance, each tagged Registered or Google.

- **Find location:** GPS detect in one tap, or open the map picker (shown by default on mobile). On the map the user drags the pin, taps a spot, uses Locate Me, or searches a pincode. Radius presets are 2, 5 and 10 km.
- **Results:** a grid of cards showing name, address, distance and, when known, phone and opening hours. On web the list is paged six at a time.
- **Registered vets** show phone and hours from our own records. Tapping one selects that vet for booking.
- **Google clinics** open a detail panel (a side drawer on web, a full screen on mobile) with a clinic photo, address, phone, a day-by-day hours table with today highlighted, and a Get Directions button that opens Google Maps to that clinic.
- **Empty results:** the search widens the radius automatically (2 to 5 to 10 km). If still empty, or Google is unreachable, the app shows registered vets only and offers an online consultation instead.
- Google's required "Powered by Google" attribution is shown wherever Google data appears.

Setting	Value
Result cache	24 hours, keyed by a rounded ~1.1 km grid cell plus radius, so nearby users share one Google call
Clinic details cache	24 hours per clinic
Clinic photos	Fetches through our server so the API key never reaches a device; browsers cache them for 24 hours
Rate limit	30 requests per minute per client on search, details and photo

Doctor and admin portals

Doctors and administrators get their own screens after sign-in, gated by role, on the website; doctors also have a dedicated tab set in the mobile app.

Doctor portal (web and mobile)

Area	What the doctor can do
Queue	See upcoming and past consultations, open one, join the video room, set its status
Availability	Add, edit, delete or bulk-set weekly working windows; toggle whether new bookings are accepted
Profile	Edit specialisation, qualification, experience, bio, fee and photo
Health records	Add, edit and delete a pet's medical records tied to a consultation

New doctors apply through an application form with document upload. Admins review it, approve or reject it, and can export or bulk-import applications by CSV.

Admin dashboard (web)

Tab	Purpose
Analytics	Store-wide overview metrics

Tab	Purpose
Orders	Filter by status, update status, add shipment details; a separate page pages through all orders
Recipes	Create and edit products and categories, manage gallery images and activate or deactivate items
Inventory	Adjust stock per product, with a weight-wise stock breakdown in the ledger
Coupons and Offers	Create percentage or flat coupons with caps, minimum order, validity and usage limits
Banners	Manage the rotating home-page banners
Feature Flags	Switch a feature on or off and choose what users see when it is off
Knowledge Agent	Manage the knowledge the AI assistant answers from

Separate admin pages cover doctors (create, edit, verify, activate or deactivate, export), clinics, consultations and support tickets (reply and change status).

Feature flags

Nine flags ship by default, all on: consultation booking, GPS locator, consultation reviews, alternative-doctor suggestions, pet photo upload, shop checkout, shop subscriptions, AI chatbot and AI pet vision. When a flag is off, an admin chooses the fallback: hide the feature, or show "Coming soon" or "Temporarily unavailable". Web and mobile both read the same flags, so one switch changes both.

Under the hood

One FastAPI backend serves both clients; heavier or separate jobs run as their own services behind a common nginx entry point.

Every client request enters through nginx and reaches one of three services

platform architecture · 2 clients, 3 services, data and external services

The backend owns the main database and business rules; the chatbot and vision services run separately, and the AI assistant performs actions by calling the backend through an MCP tool server.

Security and reliability

- **Authentication:** short-lived access tokens with refresh-token revocation; token blacklisting on logout; single-use tokens for AI-assistant actions to prevent replay.
- **HTTPS:** nginx terminates TLS with Let's Encrypt certificates (Certbot) and redirects HTTP to HTTPS; the chatbot and vision ports use the same certificate.
- **Rate limiting:** per-client limits on sensitive and costly endpoints, backed by a dedicated Redis instance.
- **Caching:** Redis-backed cache with an in-memory fallback if Redis is unreachable.
- **Background jobs:** Celery workers and a scheduler handle recurring work, including auto-closing overdue consultations.
- **Idempotency:** booking and cancellation actions from the AI assistant carry idempotency keys, valid for 24 hours.
- **Secrets:** third-party keys live only in server environment files; the mobile app holds just a restricted Android Maps key tied to its package and signing certificate.

Third-party services

Service	Used for
Razorpay	Order and consultation payments, with signature verification and a webhook
Firebase	Phone-number OTP verification
Google Places (New)	Nearby clinic search, details and photos
Google Maps SDK for Android	Map tiles in the mobile app
Jitsi Meet	Video consultation rooms
Sentry	Error reporting in the mobile app
